

WHY MIGRAINE PATIENTS NEED Balanced Pain Management

More than
**15% of migraine
patients** are
prescribed opioids to
address their pain.¹

But opioids could actually
**increase headaches and introduce
new side effects** such as:

DIZZINESS

**NAUSEA AND
VOMITING**

CONSTIPATION

**PHYSICAL
DEPENDENCE²**

Balanced pain
management allows for
**personalized,
integrative treatment**
that might include:

- ▶ CGRP inhibitors
- ▶ Botulinum neurotoxins
- ▶ Relaxation training
- ▶ Triptans
- ▶ Acupuncture

Balanced pain
management helps
reduce painful migraine
attacks—**without risking
addiction to opioids.**
